Biochemical Engineering

Chemistry and Industrial Biotechnology (BENG0031)

Description
The module aims to provide chemistry and industrial biotechnology knowledge specifically tailored for biochemical engineers. The module will introduce aspects of industrial biotechnology which are at the interface of biochemistry and chemical synthesis. The course will introduce fundamental chemistry and thermodynamics concepts in the context of industrial biotechnology, and then develop them up to advanced level using industrial biotechnology case studies.

Upon completion of the course, a student should be able to:

- Become familiar with organic chemistry underpinning enzyme mechanisms and protein chemical modifications
- Understand different thermodynamics and physical chemistry principles underpinning kinetic and equilibrium analysis of industrial biotechnology processes
- Appreciate protein structure, stability and ligand affinity mechanisms, and thermodynamics
- Discuss protein aggregation mechanisms and formulation chemistries
- Familiarise with the techniques for chemically modifying proteins and for protein engineering in an industrial biotechnology context

Assessment

Coursework: 15%
Written examination (main exam period): 70%
Oral examination (departmentally managed): 15%
