**Engineering and International Development (CEGE0025)**

**Description**
With increasing rates of urbanisation and high population growth rates in developing countries there is a need for robust engineering inputs which acknowledge societal, economic and environmental issues through partnerships with local stakeholders and institutions. This module will provide engineers an overview of the challenges and complexities of working internationally. The module will discuss theories of development and the challenges associated with infrastructure provision. The focus of this module would be for developing countries and low income communities where the mainstream development paradigms fail to address the gap in basic amenities and housing needs.
