Advanced Materials Processes and Nanotechnology (CENG0030)

Description

Aims:

To give students an understanding of processes involved in the production of novel materials.

To provide students with a systematic approach to the selection of material fabrication routes with applications to the biomedical, coating, fine chemical, food, microelectronic and semiconductor industries.

Learning Outcomes:

On completion of this course students are expected to:

be aware of novel materials and recently developed material processes;

understand essential concepts in materials science at multiple scales, from the molecules to manufacturing;

be able to apply fundamental chemical engineering principles (such as transport phenomena, chemical kinetics, thermodynamics) in the design and operation of materials processes involving nanofabrication, templating, self-assembly;

Synopsis:

To introduce the concepts of:

1. Processes in the electronics industry:
   epitaxial & polycrystalline silicon production;
   silicon doping;
   microlithography;
   chemical vapour deposition;
   physical vapour deposition;

2. Soft matter fundamentals & applications:

Key information

Year: 2018/19
Credit value: 15 (150 study hours)
Delivery: PGT L7, Campus-based
Reading List: View on UCL website
Tutor: Dr Michail Stamatakis
Term: Term 2
Timetable: View on UCL website

Assessment

- Written examination (main exam period): 80%
- Coursework: 20%
