Compilers (COMP0012)

Description

Aims:
This is a practical module whose primary goal is develop an understanding of the operation of compilers and the development and specification of computer-based languages. The course pulls together threads from underlying theory, most notably from logic and from data structures and algorithms, and builds on these a practical exercise in which students create a compiler of their own using commonly available compiler development tools.

Learning outcomes:
On successful completion of the module, a student will be able to:
1. build lexical analysers and use them in the construction of parsers;
2. express the grammar of a programming language;
3. build syntax analysers and use them in the construction of parsers;
4. perform the operations of semantic analysis; build a code generator;
5. discuss the merits of different optimisation schemes.

Content:
Anatomy of a compiler:
- The importance of compilers;
- Structure of a compiler;
- Analysis (lexical, syntax and semantic analysis);
- Synthesis (intermediate code generation, optimisation and code generation);
- Compilers vs. interpreters. Lexical analysis (scanning):
  - Tokens;
  - Regular expressions;
- Finite state automata (deterministic and non-deterministic);
- Translating regular expressions into finite state automata;
- Automatic lexer generators (JLex/JFlex). Syntax analysis (parsing):
  - Context-free grammars;
  - Derivations and (concrete/abstract) syntax trees;
- Handling ambiguous grammars;

Key information

Year 2019/20
Credit value 15 (150 study hours)
Delivery UG L4, Campus-based
Reading List View on UCL website
Tutor Dr Earl Barr
Term Term 2
Timetable View on UCL website

Assessment

- Written examination (main exam period): 80%
- Coursework: 10%
- Coursework: 10%

Disclaimer: All information correct as of June 2019. Please note that aspects of the module may be subject to change. UCL will make best efforts to inform applicants of major changes.
- Top-down parsing (LL(k) grammars, recursive descent parsers);
- Bottom-up parsing (LR(k) grammars, shift-reduce parsers);
- Automatic parser generators (CUP);
- Syntactic error recovery. Syntax-directed translation:
  - Syntax-directed definitions;
  - Abstract syntax tree construction.

Semantic analysis:
- Symbol table management;
- Scoping and type checking;
- Basic implementation techniques (Visitor methodology).

Intermediate code generation:
- Three address code;
- IR instructions;
- Translation methodologies.

Code generation and optimisation:
- Run-time storage organisation;
- A simple code generation algorithm;
- Optimisation of intermediate code;
- Optimisation of target code (Peephole optimisation).

Requisites:
In order to be eligible to select this module, a student must be registered on a programme for which it is a formally-approved option or elective choice.
